

Super Strength Fungus Interruptus™ Tech Sheet

Fungus Interruptus™ (FI) is the highest technology in the world for addressing and solving the problem of fungus of all kinds in crops everywhere. This application of quantum physics, nanotechnology, the dilution and succession process, Steiner's preparations and Wholistic™ Agricultural and Biological science gives farmers, for the very first time, near total control over all pathogenic fungi on and in their crops and fields.

FI is selective. It stops the growth of the unwanted fungal infestations while not harming the beneficial fungi in the field. No other product for fungal control can do this.

All other fungal controls kill fungi in a field indiscriminately.

FI is not a fungicide. FI does not kill anything. It merely changes the environment such that the fungus in question simply stops growing and eventually dies on its own.

FI can be used on any crop for control of any pathogenic fungi. Use it on wheat, soybeans and corn, in orchards, vineyards and commercial vegetable operations, in greenhouses, gardens and garden centers. Use it inside or outside. It even works on toenail fungus.

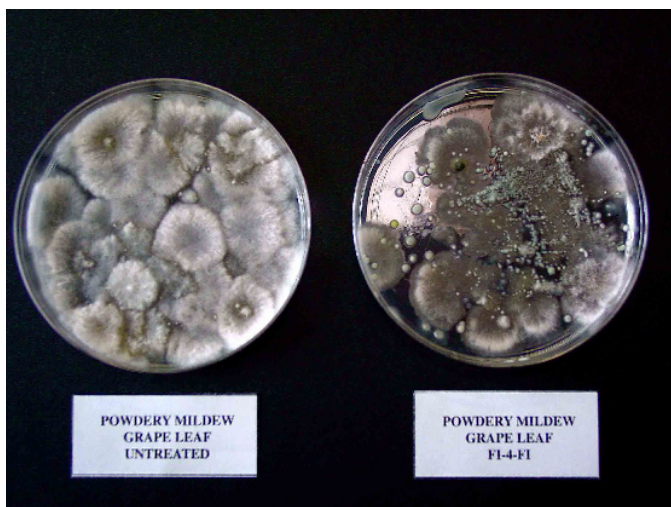

Absolutely the safest product in all of agriculture, you can use it without fear of damage to people, children, pets, livestock or your crops.

In most situations, one application will last for one month up to six months. Use it to prevent fungal outbreaks and to stop them when they occur.

Apply at a rate of only 100 ml. per acre anytime of the day or night, anytime of the year. While there is no known overdose, we recommend not exceeding 500 ml/acre and conforming with the recommendations on the label. Since FI is made from quartz, Equisetum arvense and water and is **not** a pesticide or fungicide, no registration or reporting is required.

Fungus Interruptus™ is available from our distributors or if one is not available, directly from GW Agriculture. A 2 oz. sample bottle will treat a half acre one time. Try it.

Testimonials

“I applied it to my winegrapes in late June and from then to leaf drop, I had no more powdery mildew, botrytis or any other fungus growing on my vines.” - Bob Halfhill, Agoura Hills, CA

“This is the most powerful fungal control we have ever seen for our farm. We have no more fungus problems. Our silage yields in a wet climate and our honeybees have no signs of fungus at all anymore.” - Jacqueline Freeman - Friendly Haven Farm, Washington

“Last year, wherever I sprayed FI on my blueberries, I had no problems with any fungus including mummy berries. This year, I've adopted the full Wholistic™ Agriculture crop management system for my entire farm.” - RJ Rant, Grand Haven, MI

“When I first tried FI, I was skeptical. I sprayed it on my phlox which were loaded with Powdery Mildew. All the new growth exhibited no signs of any PM. It was completely clean. Eventually, the fungus on the old growth washed off in the rain.” - Dr. Phil Wheeler, Ph.D. Crop Services International, Grand Rapids MI

“Our 40 acres of winegrapes, peaches and commercial vegetable gardens have no fungal diseases of any kind anymore thanks to FI. Our farm is now Certified Wholistic™” - Mark Collins, Buchanan, MI
